

## **OneCare's Support to Primary Care and Panel Management Efforts**

This infographic is split into three main sections to show how OneCare works to bring focus to specific clinical priorities and provides data for organizations to track improvement in these areas.

The left side highlights that in 2021, OneCare determined that there are four quality focus areas of clinical priorities. These focus areas include:

1. Hypertension
2. Diabetes
3. Depression Screening
4. Developmental Screening

54 primary care organizations were provided with data to help them understand how they are doing compared to national benchmarks on these four quality focus areas. Incentives are tied to providing higher quality of care.

On the other side of the infographic, two text boxes highlight the following information. First, 98% of organizations scored above the set benchmark or higher in the first round of data collection for at least one of the measures mentioned (hypertension, etc). Next, 84% of organizations scored above the more ambitious stretch goal in the first round of data collection for at least one measure. Finally, there is a highlighted box stating that OneCare engages with any organizations performing below target to work on improvement plans.
